

MoldMan™ 8000 : Presentation

The Moldman™ 8000 is ideal for low to high volume production quantities. It is an automated single station Low Pressure Molding machine with an impressive track record. This is our most popular machine often used in three-shift operation.

How do we make a single station machine perform when high yearly volumes are needed? Ask us about our unique moldset solutions, multi cavities, pallet loading systems and more.

The Moldman™ 8000 is equipped with our proprietary pressure control system. This system controls volume and pressure independent of each other providing the flexibility to over-mold complex circuit boards and connectors.

Cooled mold platens eliminate hoses to the moldset providing easy access for loading and unloading molded components.

Why chose a Moldman™ Machine?

Moldman™ Machines are designed exclusively for Low Pressure Molding. Focused on user friendliness, long service life and minimal maintenance. They are integrated, purpose built LPM machines, designed without maintenance intensive items.

- No heated hoses
- No exposed heated joints
- No exposed moving injection nozzles
